this is not so marked as in *O. beatrix,* which is largely white with, however, brown legs. The Gemsbok is a handsome creature with ^rreyish tawny colour, much darker on the legs, and with a Gazelle-like, dark, side stripe. It has received its vernacular name on account of its supposed likeness to the Chamois (" Gemse "), just as the Rehbok was so-called from its supposed likeness to the Roe Deer, and the Eland to the Elk. The Beisa (O. *beisa)* is of a similar tawny colour to the last., and also "with, darker stripes.

The Addax *{A.ddaa?)* of Xorth Africa^ Arabia and Syria, has but one species (^4, *nasomaculatus).* The horns are spirally twisted.

The Tragelaphine section includes the Kudus, Elands, Nilgais,

FroffeZajpfcits *spekii* (9). ^tS*.

and Harnessed Antelopes. **They** are **all** long-horned (when the horns are present in both sexes), the horns **being** twisted; the nose is naked with u slight **median groove,** and all are Ethiopian or Oriental in range.

The genus *Trayelaphus* includes the Harnessed Antelopes, so called on account of the direction of the stripes suggesting harness. The females are hornless, and the colours of the two sexes are different. The hoofs are long and the toes rather

unusually **separable,** which **state** of" affairs is in accord, with the
